A close-up photograph of an ATM's internal cash cassette. A thick, silver metal locking barrier is positioned between the cassette and the rest of the machine. The barrier has a textured surface and several circular indentations. The cassette itself is visible, showing a green and yellow label with the number '510'. The background is a blurred view of the ATM's internal components.

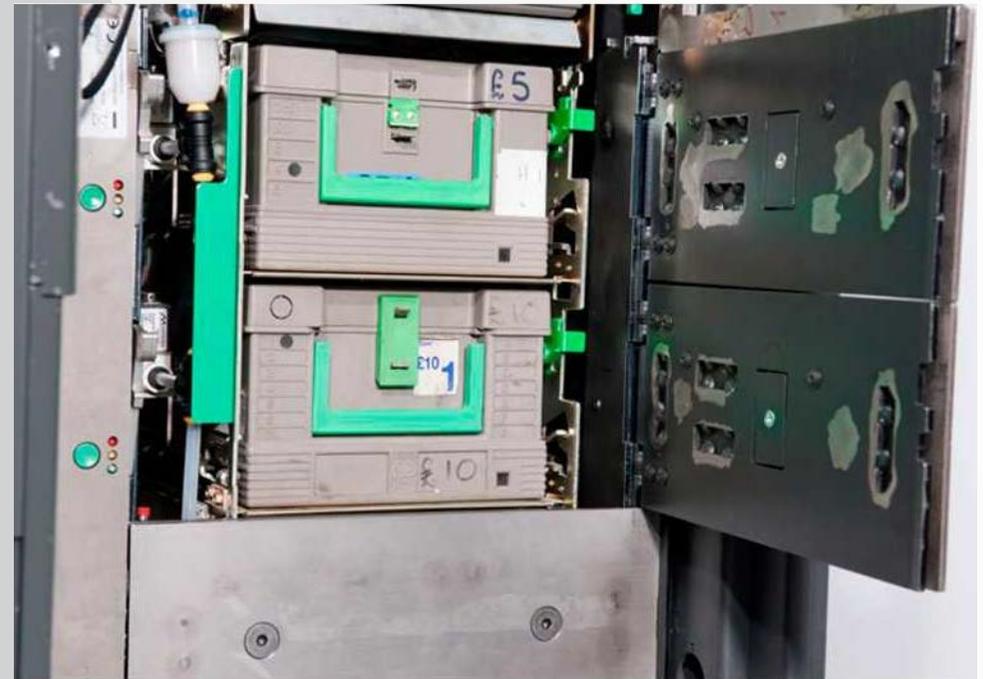

WHAT IS THE GRYPHON LOCKING SYSTEM?

The Gryphon Locking System is by any measure one of the most effective deterrents to physical attacks on ATMs. It works by placing a strong and sophisticated physical barrier between the cash cassettes in an ATM and the robbers who have their eye on the prize.

HOW DOES IT WORK?

The original philosophy behind the Gryphon Locking System was to limit losses by ensuring only one of the four cash drawers could ever be open at any one time, thus rendering attacks no longer 'cost-effective'. It evolved out of a close partnership with clients whose CIT teams were increasingly targeted by armed gangs.

While the concept is relatively simple, its execution is based on high quality precision engineering and electronics. The electronic mechanism ensures that only one of the four interlocking protective steel doors that protect the four cash-dispenser drawers can be open at any one time. Once closed, no door can be reopened until a preset time has elapsed.

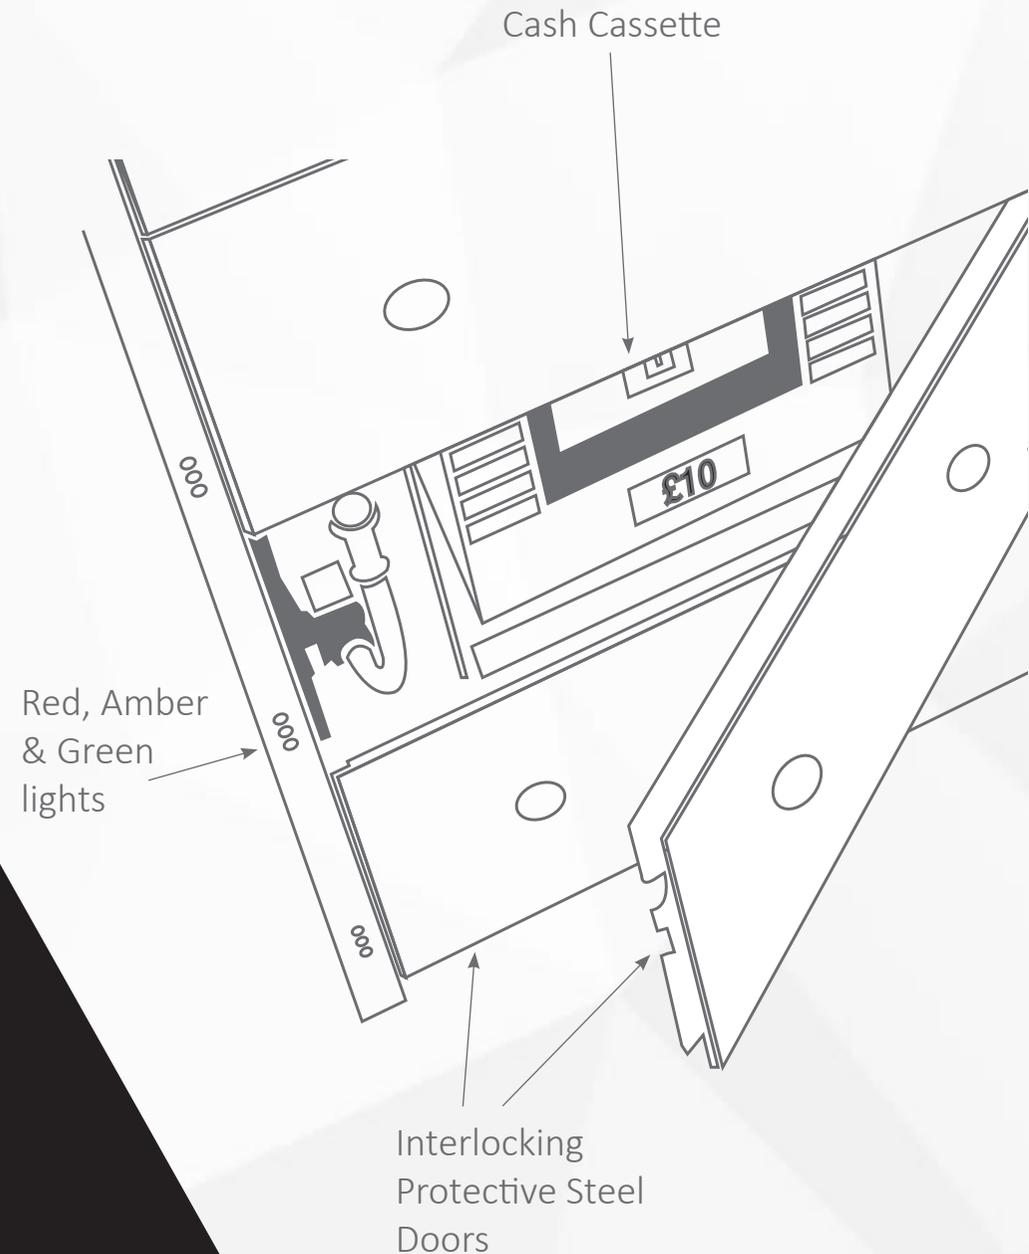

WHAT MAKES THE GRYPHON LOCKING SYSTEM DIFFERENT FROM OTHER SYSTEMS?

The Gryphon Locking System is the only physical defence system designed to offer a powerful response to the full range of criminal attack methods deployed against the ATM estate. From armed robbery and duress against cash-in-transit replenishment teams, to brute force, burglary, ram raid and explosive gas.

“I am very impressed by the results. The machine protected the cash, which is obviously what the criminals are after. It will hopefully be a massive deterrent to them. A very positive outcome certainly for this company and this device - I am really impressed with it.”

DC ADRIAN ROBERTS

West Midland Organized Crime Unit &
UK representative to Interpol on ATM attacks

PROVEN PROTECTION AGAINST ATM GAS ATTACKS

Gas attacks on ATMs arrived in the UK in 2013 and eventually reached the US. By the Autumn of 2015 there had been nearly 150 such attacks, costing the UK banking and cash machine industry a significant seven-figure sum.

A majority of gas attacks have been 'successful' for the criminals and although some perpetrators have been convicted, police fear copycat gangs are increasingly putting lives at risk.

“ *After seeing the tests live and previously seeing them simulated, I do have a lot of confidence that should a gas attack occur where a gryphon door is deployed, then the criminals are not going to be able to touch the money, which is the main objective.* ”

HEAD OF SECURITY AND RISK
Leading IAD

JUST HOW EFFECTIVE IS THE GRYPHON LOCKING SYSTEM?

Armed robbery and duress - It's a full decade since the first system was developed to combat a growing threat to ATM replenishment teams.

This had escalated to the point at which members of the public, as well as security and bank staff, were at increasing risk of injury. In the year after a customer fitted the Gryphon Locking System to the majority of its estate, seven-figure losses fell by 90 per cent and injuries to cash-in-transit and other staff by 83 per cent.

Our response to the increasing risk of ATM gas attacks is the gryphon Locking System - capable of withstanding blast pressures in excess of 15 bar.

BURGLARY AND RAM-RAID

The Gryphon Locking System won't stop a gang from ripping an ATM out of the wall and taking it away. But it will remain very difficult for them to get at the cash. The sophisticated construction using varying grades of steel makes it resistant to grinding, hammering and oxyacetylene. Indeed, because the different components melt at different temperatures, the money will catch fire before the thieves can get at it.

The perfect partnership between the Gryphon Locking System and an ATM tracker results in slowing down an attack on an ATM. As soon as an ATM is removed from a site, the tracker is triggered and alerts its location to the police. The Gryphon Locking system will not be defeated before the police arrive!

BRUTE FORCE

The Gryphon Locking System, unlike less sophisticated competitors, is highly resistant to all types of physical attack.

GAS ATTACK

No ATM fitted with a correctly deployed Gryphon Locking System has been breached in an attack using injected gas. The design has been successfully tested in the lab and in the field.

Although robbers continue to target ATMs known not have a Gryphon Locking System fitted, the device has brought seven figure savings to the ATM industry.

The cash is safe after a simulated gas attack

CENNOX SECURITY SOLUTIONS

SECURITY FOR THE ATM

Cennox provides a leading portfolio of Security Products aimed at protecting our customer's ATMs and limit the impact criminals can make on their estate.

Our in-house R&D Team, working in partnership with many of our banking customers, continue to lead an effective response to the latest threats.

In addition, Cennox also provides effective Asset Tracking solutions using the latest electronic satellite pursuit & GPS techniques to retrieve stolen assets and apprehend criminals.

INTELLIGENT SECURITY

Dealing with intelligent threats at the ATM has driven the industry to provide solutions for these criminal activities. Cennox has a portfolio of intelligent solutions producing real protection as well as visible deterrents.

- Anti-Skimming Devices
- Anti-Black Box & Jack-potting Devices
- Asset Tracking Solutions
- Ink & Glue Note Destruction Solutions
- Anti-Gas Detection Solutions

PHYSICAL SECURITY

Global ATM providers face an increasing number of physical attacks, from ram-raid and pull out incidents, to traditional safe breaking under the cover of darkness. Our solutions detect and prevent even the most persistent criminal.

- Plinths
- Locks, Chains & Anchors
- Smoke Deterrents
